

Virtualisation

Submitted by: Storacall

Monday, 27 June 2016

Many organisations are already turning to server virtualisation to reduce data centre costs, optimise infrastructure and improve availability and business continuity. Storacall ST call recording can easily be installed on virtual machines, making it an excellent recording solution for VoIP users..

Storacall offers high-availability support for the leading virtualisation solutions, including VMware, Microsoft Hyper-V and Citrix XenServer. Our web-based solution enables hosted operating systems and applications to be used in remote locations, with central management and administration.

This technology has an immediate impact on both current and prospective customers by minimizing investment in physical hardware by capitalizing on clients' existing infrastructure as well as reducing costs on facilities, power, hardware, simplified administration and maintenance as well as providing a greener IT profile.

Storacall-ST has been developed by Storacall using Microsoft ASP.net development & application environment with a distributed Realms architecture and because of it's modular design capitalising on existing familiar IT infrastructure, it is easy to meet evolving needs, including expanding capacity or adopting new technologies. Storacall ST is designed to provide solutions in challenging environments including call centres and customer support operations and is particularly suited to multi site applications.

For further information on Storacall virtualisation or the range of Storacall ST call recording solutions contact the Storacall sales team on 01932 710710 or email: sales@storacall.co.uk
