

Krone halves the cost of speech

Submitted by: Turtle Consulting Group

Monday, 17 May 2004

A new RJ-45 patch panel designed specifically for bringing voice circuits into structured cabling systems has been launched by Krone - ingeniously value engineered to a mere 50% of the cost of its previous voice product.

The new patch panel packs 50 ports into 1U - meaning that 2,100 ports can now be packed into a single 42U 19 inch cabinet, rather than the 2.1 racks needed with conventional 24 port units. A second significant saving.

Far from being of a lesser quality, the innovative new Voice Patch Panel has additional features such as a sliding 'drawer' mechanism, which is the equivalent of a built-in outrigger. Once installed into the rack or cabinet, the 'works' can be slid forward and tipped downward giving easy access for the installer to terminate the telephony cables, or to add-in further cables to part terminated units.

The new Voice Patch Panel is also available in a 1U 25 port variant. Both types can be wired for 2-pair 258A voice configuration. Being 50 port and 25 ports rather than 24, the new Krone Voice Patch Panel is ideally suited for the termination of 25, 50 and 100 pair CW1308 telephony cables from PBX or other voice applications.

Both products are engineered and manufactured to Krone's normal high quality standards, featuring an expansive cable management area to offer maximum protection to the cables, and shipping complete with an accessory kit of labels, fixing screws and cable ties.

As with all Krone voice and data products, the Voice Patch Panel features the unique LSA-PLUS® quick connection punch down connectors - for maximum life and reliability.

For further details on the new 50 port and 25 port Voice patch panel contact contact@krone.co.uk or 01242 264444.

Alternatively, please contact your usual KRONE Distributor.
