---

Following in the successful release of the Super-i-Stor storage solution, Boston Limited is offering a free evaluation service to all customers, or potential business users, who would like to learn more about the increasingly popular iSCSI technology deployed in the system.

Developed by the Internet Engineering Task Force, iSCSI is an IP based storage networking protocol facilitating SCSI commands to be carried over IP networks. iSCSI can be used to help data transfers over intranets and also to manage storage over wide area networks and great distances. iSCSI is the key catalyst for the development of Storage Area Networks and location independent data storage, retrieval and management.

Boston's impeccable attention to detail, superior build quality and choice of high quality, compatible and validated, components allows us to offer you a high-performance, resilient IP based SAN at a fraction of the cost of equivalent traditional SAN technologies.

Seemingly endless RAID options are available with the Boston Super-i-Stor making it possible to create new and unheard of configurations!

Storage targets are made up of 3U rack-mounted chassis with the ability to accept up to 15 x 1" standard Serial ATA or SCSI hard disk drives. Each of these is usually fitted with redundant hot-swap power supply units and multiple hot-swap cooling fans.

Based around a pair of 12U rack cabinets, for easy transportation, the Super-i-Stor being made available for this FREE evaluation offer, provides up to 12TB of storage capacity which is handled by 4 storage servers. In addition you will be supplied with a dedicated iSCSI initiator, switch and a 1U KVM with 15" display – that is a fully configured iSCSI storage environment – just add users!

If you are serious about storage, call Boston Limited now to book your free evaluation.
