URL Filtering and Anti-Malware Technologies, Engines and Databases Provide Network Security Vendors with Product Differentiation and Enhanced Value in Competitive Market

Broomfield, Colo. – March 12, 2008 – eSoft, Inc., a leading vendor of integrated Internet security and content management solutions, announced today that it is offering its award-winning network security technologies and databases to Original Equipment Manufacturers (OEMs) for product integration.

eSoft's first OEM customer, which will remain anonymous, will incorporate eSoft's SiteFilter™ and Distributed Intelligence Architecture™ (DIA) technologies into its offerings to provide product differentiation and incremental revenue opportunities for both its existing and future products.

eSoft's SiteFilter has quickly emerged as a leading URL and web content filtering offering, with over 50 million URLs in 53 categories. eSoft's DIA collects and categorises over 300,000 new URLs daily and provides real-time reputation services for new malicious websites, including phishing, adware and spyware sites. In addition, eSoft offers OEMs enhanced anti-malware, subscription management, anti-spam and IP reputation technologies individually or in a complete turn-key solution.

"The first OEM customer decided to go with our solutions based on the comprehensive coverage and accuracy of the SiteFilter URL database, as well as the capabilities of DIA to collect and rapidly categorise new URLs," said Jeff Finn, eSoft's chief executive officer. "We believe this agreement, along with the patents eSoft holds, provides further validation that eSoft is emerging as a technology leader in the area of network security."

About eSoft, Inc.

eSoft, Inc. (www.esoft.com) is a leading provider of integrated Internet security solutions offering organisations protection from dynamic Internet-based threats. eSoft's award winning InstaGate™ and ThreatWall™ platforms offer high-performance Deep Packet Inspection security services including Firewall/UTM, complete email security and total web security. eSoft solutions are based on purpose-built hardware platforms running security software modules called SoftPaks™, which are distributed and maintained through eSoft's patented SoftPak Director™ technology. eSoft solutions offer IT managers extreme simplicity and flexibility when deploying and managing network security. Fewer demands for time and security expertise from IT staff lower the total cost of ownership.
