GFI EventsManager with LOGbinder SP offers new log monitoring,
alerting, reporting and archiving capabilities for SharePoint® users

London, UK – May 3, 2011 – GFI Software, a leading IT solutions provider (http://www.gfi.com/) for
small and medium-sized enterprises, today announced it has added enhanced security and compliance
features to GFI EventsManager™ 2011 (http://www.gfi.com/eventsmanager), including Microsoft®
SharePoint® log management (http://www.gfi.com/eventsmanager/esmnew.htm), and auto-update patch
management capabilities.

GFI EventsManager enables IT administrators to meet a broad array of network and data security,
regulatory compliance, business continuity and e-discovery requirements by monitoring, logging and
analysing all events occurring on a network. The latest version of GFI EventsManager applies these same
log monitoring and reporting capabilities to SharePoint environments.

"As businesses continue to move large amounts of sensitive data into SharePoint, it is essential that
they track user activity for security and compliance purposes," said Lucian Mocanasu, product manager,
GFI Software. "Through a strategic partnership with Monterey Technology Group, GFI EventsManager 2011
can be deployed with their LOGbinder SP solution to provide SharePoint users with unmatched event
management and reporting."

Without a solution like GFI EventsManager and LOGbinder SP, administrators have no easy way to monitor
SharePoint activity. While SharePoint offers an audit log solution, many organisations require more
robust capabilities such as matching users to specific events and generating detailed reports and audits.
GFI EventsManager 2011 enables administrators to more effectively monitor SharePoint, preventing data
leaks, minimising downtime, and ensuring compliance and security practices are enforced.

"Companies must now implement the same level of security and compliance measures at the application
layer as they do at the operating system and network device layers," said Randy Franklin Smith,
president and CEO of Monterey Technology Group. "GFI EventsManager with LOGbinder SP delivers a
SharePoint solution that meets the application-level audit requirements that many organisations have not
yet implemented."

LOGbinder SP - a Windows®-based service that can be installed on any SharePoint server - monitors
SharePoint events and translates that activity into a Windows event log. GFI EventsManager then collects
the events generated by LOGbinder SP and archives the logs into one centralised database for easy
management and analysis.

"GFI EventsManager enables users to consolidate SharePoint activity with other important events, giving
them a holistic view of everything happening across the entire network," added Mocanasu. "Having a
single point of reference when monitoring network activity makes it easier than ever for administrators
to analyse event logs and use that information to correct issues, protect sensitive information, and

demonstrate compliance with corporate, industry and government regulations."

The new version of GFI EventsManager also includes an auto-update feature, which frequently monitors for product updates and automatically downloads and installs them.

GFI EventsManager is award-winning software that supports, centralises and analyses a wide range of event log types such as W3C, Windows events, SQL Server and Oracle audits (http://www.gfi.com/page/68965/gfi-launches-gfi-eventsmanager-2011-with-oracle-audit-support), Syslog and SNMP traps generated by devices such as firewalls, servers, routers, switches, sensors, SQL Server systems, PCs and custom devices.
