· 1E's latest software product enhances client deployment for Microsoft Systems Management Server 2.0

1E has launched its latest software product, SMSCliantMaster.

SMSCliantMaster assists in the deployment of Microsoft Systems Management Server 2.0, enabling the installation of SMS client software on some or all Windows NT- and Windows 2000-based systems.

SMSCliantMaster is one of a series of leading software products developed inhouse by 1E's highly skilled multinationally based development team.

Microsoft Systems Management Server is the leading PC systems management solution and has a large installed user base. SMSCliantMaster enables complete control of the rollout and subsequent maintenance of the Systems Management Server client software to Windows NT- and Windows 2000-based systems.

"Customers have been asking us to make it even easier to roll out Systems Management Server in their enterprises as they realise its total cost of ownership benefits," said David Hamilton, lead product manager for Management at Microsoft Corp. "We're delighted to see 1E make this Systems Management Server deployment tool available and to add it to its existing selection of Systems Management Server enabling solutions."

SMSCliantMaster makes the system administrator's life easier by enabling the deployment of the SMS client software - no training is required.

SMSCliantMaster extends the existing SMS administrator console interface, therefore all functions are accessed from familiar menus within the interface.

- ENDS -
