

StaySafe add satellite device to lone worker product range to protect vulnerable staff working anywhere in the world

Submitted by: StaySafe

Tuesday, 19 September 2017

StaySafe is now integrated with the Garmin inReach satellite device to offer businesses a reliable way to safeguard staff who work in the world's most remote areas.

StaySafe offer a range of lone worker safety solutions for businesses looking to meet their duty of care to employees. With inReach, StaySafe is now able to offer protection in the most remote areas of the world – including oceans, airways and polar regions.

Garmin inReach is a small, affordable satellite communications device which offers 100% global coverage through Iridium's satellite network. Accurate location tracking allows remote workers to be monitored from the StaySafe Hub, while an SOS panic allows them to signal for help in an emergency.

If a panic alert is triggered on the device, StaySafe will notify a monitor immediately, allowing an organisation to take action.

The device also helps lone workers to navigate in extremely remote areas, with a range of handy features including a compass, weather reports, satellite mapping and a digital breadcrumb. A long battery life ensures users are reliably protected, lasting up to 100 hours in tracking mode or 30 days in power saving mode.

Designed to survive harsh environments, inReach is waterproof, buoyant and impact-resistant. Compatibility with a range of accessories means the device can be worn on a lanyard or mounted to a vehicle for the user's convenience.

Flexibility of data packages and the ability to assign between employees from the Hub means StaySafe's satellite device is scalable for an organisation's individual requirements.

Don Cameron, CEO StaySafe comments: " Using the StaySafe app on a satellite device means the worry of keeping track of staff in mobile blackspots is a thing of the past. Utilising satellite coverage allows us to offer employers a lone worker device that can monitor employee safety anywhere in the world, with no reduction in functionality or accuracy. Plus, as the satellite devices can be monitored within the same online Hub as regular smartphone StaySafe users, employers can keep track of all staff in one place using the device that is most suitable for each individual employee"
