Osirium launches first secure solution to automate key IT processes and increase IT Service Desk productivity, while also improving corporate security

Theale, UK — 1st May 2019 — Osirium Technologies plc (AIM: OSI.L), a leading vendor of cloud-based cybersecurity software, today announces the immediate availability of Opus, its secure IT Process Automation solution.

Opus builds on Osirium's proven success in Privileged Task Automation, providing a highly-flexible platform for automating essential IT processes. The product has been designed to address currently unresolved challenges of overloaded IT teams, growing backlogs of customer requests and increasing needs to improve security.

"Traditional ways of automating IT processes are inflexible, risky and not fit for the security-conscious 21st century IT organisation," said David Guyatt, CEO at Osirium. "IT Operations teams need a much better alternative, built from the ground-up, to be fully secure and integrated for simple deployment and rapid speed to value. They want the benefits of Robotic Process Automation, but with enterprise-grade security. Opus delivers this by automating processes and controlling access to privileged accounts, addressing one of most critical enterprise security challenges facing CISOs, to remove unnecessary direct access to vulnerable privileged accounts."

Initial customer projects for Osirium's Opus are focused on IT Help Desks, principally transforming first call resolution performance by delegating help desk automation tasks to first line support teams – a practice known as "shift-left" operations. Looking further ahead, Osirium sees clear scope for automating additional process-driven environments, such as NetOps, DevOps and IoT.

## Opus Availability

Opus is available now on request from Osirium. Please access [www.osirium.com/opus](http://www.osirium.com/opus) for more information.

## About Osirium

Osirium Technologies plc (AIM: OSI.L) operates in one of the fastest growing parts of the cybersecurity market and is a leading vendor of Privileged Access Management ("PAM") software. Osirium's cloud-based products protect critical IT assets, infrastructure and devices by preventing targeted cyber-attacks from directly accessing Privileged Accounts, removing unnecessary access and powers of Privileged Account users, deterring legitimate Privileged Account users from abusing their roles and containing the effects of a breach if one does happen.

Osirium has defined and delivered what the Directors view as the next generation PAM solution. The team has developed the concept of a Virtual Air Gap to separate users from passwords. Built on Robotic Automation technology, Osirium's Privileged Task Management module further strengthens Privileged Account security by minimising the cyber-attack surface and delivering an impressive return on investment benefits for customers.

Founded in 2008 and with its headquarters in Reading, UK, the Group was admitted to AIM in April 2016.
