

Cytoplan releases New, Improved Phyte-Inflam food supplement

Submitted by: Cytoplan

Tuesday, 23 January 2018

Cytoplan has released its new and improved Phyte-Inflam food supplement, which now contains liposomal curcumin and gingerols.

Phyte-Inflam is a natural phytonutrient herbal complex containing curcumin from turmeric and gingerols from ginger root, which together bestow its beneficial properties.

The piperine previously present in the supplement has been removed and the new formulation provides liposomal curcumin which is better tolerated, more bio-effective, and has fewer medication interactions.

Research has shown that the bioavailability of curcumin is generally poor, and this has limited its therapeutic usefulness. The liposomal form of curcumin has been found in research to be significantly more bio-effective, with absorption being 45 times higher than standardised curcumin.

The new and improved Phyte-Inflam supplement will be available from mid-February 2018 and orders can be placed online through our website (<https://www.cytoplan.co.uk>) or by calling 01684 310099.
